Entry ->

Application Host

registerAuth(app) | registerActivities(app) | registerNutrition(app) | registerGoals(app) | registerAnalytics(app)

↓ Each module routes its own routes under /api/v1

Modules ->

Single Process - /server/modules

Authentication

- Accounts and tokens

Public Contract

- getUser(id)
- verifyToken(t)

Private

routes.ts

service.ts

repository.ts

Calls:

- Does not call anything as it is self contained

Activities

- Sessions across every sport

Public Contract

- listForUser(id, range)
- totalsByWeek(id)

Private

routes.ts

service.ts

repository.ts

Calls:

- Does not call anything as it is self contained

Nutrition

- Nutritional entries and daily totals

Public Contract

- dayTotals(id, date)
- macroTrend(id)

Private

routes.ts

service.ts

repository.ts

Calls:

- Does not call anything as it is self contained

Goals

- Targets set by the user, and progress against them

Public Contract

- createGoal(id, spec)
- getActiveGoals(id)
- checkProgress(id, goalId)

Private

routes.ts

service.ts

repository.ts

Calls:

- Activities & Nutrition (via their contracts)

Analytics

- Progress charts. Recomputes on every request

Public Contract

- Consumer only

Private

routes.ts

service.ts

repository.ts

Calls:

- Activities & Nutrition (via their contracts)

Event Bus

activity.logged - goals re-checks progress on the athletes active targets

User.deactivated - modules stop serving that user, nothing is deleted

↓ Every module uses the same platform code

Platform ->

Platform code - /server/platform

Authentication middleware

- Checks the token once, for all routes

Prisma Client

- One pool, one shared schema.prisma

Config

- Environment variables

Logging

- Request logs and error tracking

Errors

- One handler, one response shape

Database ->

PostgreSQL

Auth

users

Activity

Sessions | Metrics (jsonb)

Nutrition

Entries | Foods | Water

Goals

Targets | Progress_Marks
